

# Component based model

Tuesday, 27 November 2018

9:59 AM

Every UI section can be developed as a component in angular. E.g header , footer, menu bars etc. Each component will be assigned with a HTML tag or Selector w.r.t to there name.

This selector will be consumed as tag in any html page in your application. e.g- `<MyAppHeader></MyAppHeader>`

These component could also have sub components or also small components, so every component in Angular must have root component (similar to tree structure)

Similary, every Angular application will have a root component.
