

How to build Angular App

Wednesday, 2 January 2019

10:37 AM

During development we use "ng serve" command to deploy and run angular application. Doing this ng serve we can see in console the message that application is running development mode and in network tab of browser all the js will be loaded.

This can be a performance issue and cannot work in prod or live application.

Instead of ng serve

1. Let's run "**ng build --prod**", this will create a separate folder as **dist** with index.html and our js files.
2. Install node http server: **npm install http-server --global**
3. Now pass directory: **http-server dist/Project**
