Creating new component

Using cli -
        ng generate component <name-of-component>

This command will create .css,.html,.ts,.spec.ts and also updates app.module.ts

This new component will have a selector assume <hello-world-component> , this selector we can refer to parent app.component.html.

This will world because HelloWorldComponent is imported in app.module.ts

```
import { HelloWorldComponent } from './hello-world/hello-world.component';
```
