App Component introduction

Tuesday, 27 November 2018   1:55 PM

Root component - index.html

This html will be containing <app-root> tag which will be pointing to parent component.

app.component.ts and app.component.html will be containing the code as parent component.
In any component.ts file
    selector defines tag library must be used or referred in any html. **E.g - selector:'app-root'** defined in app.component.ts templateUrl will be referred to html location and styleUrl refers to css file location

Every Angular component is mainly a TypeScript class. Think of html and css files are just attachment to this TypeScript file.

Databinding is refers to binding the data in the component instance to HTML template. E.g. {{ message }}
